TS RANGE

GAS, LIGHT OIL, HEAVY OIL
AND DUAL FUEL

DUOBLOCK BURNERS FROM 230 TO 34000 kW

Our proposal

Ecoflam offers a full range of blown air pressure jet burners granting high efficiency and reliable operation with significant energy savings. All models feature extreme ease of installation maintenance and flexible boiler–burner matching. All products are conform to CE standards and are manufactured in accordance with ISO 9001 (quality management system), ISO 14001 (environmental management) and OHSAS 18001 (occupational health and safety management).

Our expertise

Thanks to its strong attitude in customization, besides its wide range of standard burners for all fuels, Ecoflam boasts many different solutions for different applications.

For more than 40 years, Ecoflam has been working continuously on new developments and the optimisation of existing products. The Ecoflam philosophy of continuous development, implemented in our laboratories, allows us to go forward and produce better results, such as the reduced NOx level emissions.

Our worldwide network

Manufacturing is carried out in the factory of Resana (Treviso - Italy) and products are distributed worldwide thanks to a wide network of partners. In forty years, Ecoflam has been capable to build loyal partnerships and today can count on reliable Partners in more than 60 Countries.

You can fully trust in our partners, they distribute Ecoflam products in their Countries of competence, they have good knowledge of the products, they are well trained under the technical point of view and they carry out commissioning and service by keeping constantly in touch with the headquarter.

All the benefits of the separate ventilation

In contrast to monoblock burners, duoblock burners are made up of two units, or blocks, as the name implies: the burner head with the air inlet, and the separately-installed fan; the two units are connected via an air duct.

The separate installation of the fan offers several benefits:

- the fan can be installed in a separate room, for instance in the cellar; this results in considerably lower noise levels in the boiler room; when the fan is installed in the same room, a fan enclosure can be used to achieve optimum sound absorption, without inhibiting access to the burner;
- less space required in front of the boiler and in the combustion chamber;
- individual fan layout with optimum adaptation of the fan characteristic curve to suit the pressure ratio of the heat generator; this guarantees pulsation-free and stable burner behaviour, even on heat generators with high resistance on the exhaust side;
- combustion air can be pre-heated to increase installation efficiency;
- lower weight loading on the boiler front.

Maximum flexibility for highly customized solutions

Thanks to their extreme flexibility and ease of use TS burners are suitable for all types of installation from 200 kW up to 34 MW. Terminal block configuration is provided as standard; versions with integrated control panel are available on request.

Burners can be assembled with air duct connection in different layouts in order to meet a wide range of specifications in terms of performance and overall dimensions.

Low maintenance, high reliability

All TS range models feature easy maintenance.

Access to the combustion head and to the internal components is allowed from the housing top cover with a single operation, without removing the burner from the boiler.

The clear layout allows rapid cleaning of the mechanical components, keeping the installation always in good conditions.

Hot air configuration

TS range can run in standard configuration with air up to 60°C.

Versions suitable to work with pre-heated combustion air up to 200°C can be used in order to achieve greater values of efficiency.

Standard configuration:
loose version with
derivative panel

IP55 Switch cabinet
configuration:
version with assembled
or remote switch cabinet

Pre-heating
pump station

Separate ventilator

Gas train unit

Modulation Kit

Gas governor/filter
Compulsory EN676

Max pressure switch

Tightness control
Compulsory EN676
(over 1200 kW)

**INVERTER SYSTEM
O₂-CO TRIM CONTROL
MONITORING APPLICATION**

BMS (Burner Management System) allows to improve performance and efficiency of modern firing installation. This system is designed to be matched with an extensive range of components such as flame, temperature and pressure sensors, gas valves, variable speed fan motors and oxygen control that can be managed from different bus interfaces

TS RANGE

VENTILATOR

How to choose the correct ventilator

According to the application output or the fuel flow rate we need to calculate the **air needed** considering the following data:

- Output / Fuel air flow;
- Temperature of combustion air;
- Backpressure in the combustion chamber;
- Sea level altitude.

In order to dimension the correct ventilator the following calculation has to be made:

1. Air flow needed

2. Pressure needed

First of all we need to calculate the air flow needed in function of Nm³/h for gas or kg/h for oil and multiply it for the following suggested coefficients:

Natural gas: K=12

Light oil: K=15,7

Heavy oil: K=15

Example:

1000 Nm³/h of gas

The quantity of air will be:

1000 [Nm³/h] x 12 = 12000 m³/h of air

This value must be adjusted according to the following:

1. temperature of combustion air
(standard 20° C; see table for different temperature);
2. sea level (refer to the table for correction factors);
3. air loss of the connecting pipes between burner head and ventilator (estimated to 5%).

Results will be the following for an installation at 500 m from the sea level and with air at 50° C:

12000 [m³/h] x 1,05 / 0,855 = 14737 m³/h

Total air pressure:

to finalize the calculation we shall consider the following factors:

- head loss of the burner* (see following pages);
- backpressure in the combustion chamber;
- additional loss given from accessories like heat exchanger, filters, ...

*: pressure losses calculated at sea level at 20° C;
the value must be adjusted according to the correction factor

1000 Nm³/h gas for BLU 10000.1

10000 kW (L.C.V. 8570 kcal/Nm³)

- head loss = **35/0,855 = 42 mbar**

- backpressure installation = **15 mbar**

- additional exchanger = **15 mbar**

Total: 42+15+15 = 72 mbar

Final data achieved for selecting the ventilator:

1. Air needed = 14737 m³/h

2. Pressure = 72 mbar

Flame lenght (gas burners)

Flame diameter (gas burners)

Data may vary depending on the configuration of the burner, the pressure of the combustion chamber and the draught. The values in the graphs refer to tests carried out with flame tubes.

Example:

Burner output: 8000 kW

L flame (m) = 5 (medium value)

D flame (m) = 1 (medium value)

Modifications to the flame can be made in our Flexshop in order to shape the flame and meet specific requirements for special boilers or applications
