## ELCO sets the standard for perfection with its gas, light oil and dual fuel program

### Reliable heating solutions for every requirement

Wherever small or medium-scale heating solution is needed, ELCO is the best partner you can rely on. A comprehensive offer of tailor-made solutions is proposed by ELCO and offered by its worldwide network of distributors.

A partner in professional heating offering a wide range of burner operations to fit individual and commercial needs with optimum combustion technology respectful of sustainable environment.

### VECTRON: an optimal combination of experience and innovation

With its gas and light oil burners series VECTRON, ELCO offers a product range capitalising more than 90 years of experience in the development of burners in all sizes.

All burners series VECTRON are characterized by economical consumption, ease of installation, adjustment and maintenance embedded in an excellent product engineering.

The new generation models are equipped with an integrated display featuring an interactive, intuitive communication system.

Burner and packaging are 100% recyclable.

### VECTRON G

Ranging from the output of 14,5 to 2300 kW VECTRON models offer a wide choice of operation, one and two stages, progressive pneumatic, modulating with electronic compound and a complete program of gas burners with speed control.

### VECTRON GL

ELCO offers its dual fuel range working in gas and in light oil from 35 to 2050 kW, with models available in one stage, two stages and progressive pneumatic operation.

### VECTRON L

The light oil program ranging from the output of 11 to 2080 kW includes powerful variants for all applications and low-emission models with Blue and Yellow flame technology.

### Competent advice

Your contacts at ELCO and its partners are recognized experts with years of experience.

Our worldwide support starts from concept creation to planning, design and project management up to commissioning and on-going operation of the plant throughout its life cycle.

### Outstanding service

As an ELCO customer, you can rely on your installation to perform reliably.

Our guarantee is backed up by a service that sets standards in our field.

# ELCO OPERATIONS AND SYSTEMS

## Communication

### Choose an intuitive and interactive system

The new MDE2 System and the Elcogram, equipped on VECTRON range constantly give real-time information to professional operators.

- **During the commissioning**

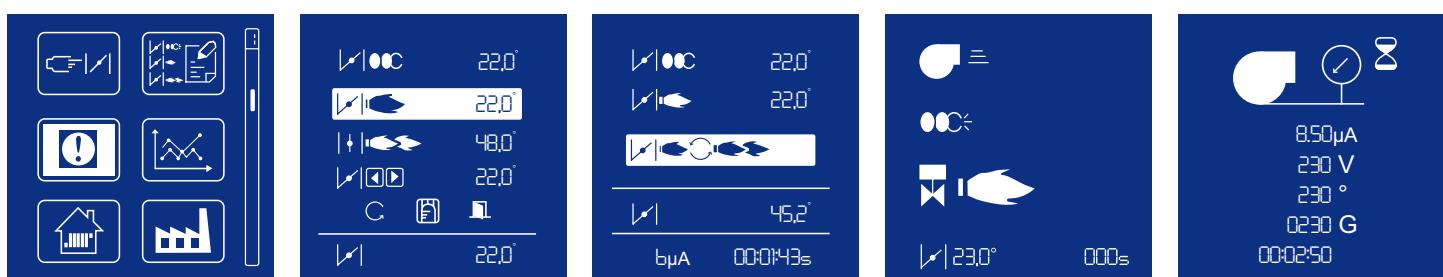

The setting of all necessary parameters for the burner operation is carried out by a user-friendly method thanks to the 5 buttons and the big size display.

- **During the burner operation**

The instantaneous data of each ignition follow one another in real time, allowing a quick check of the burner running (voltage value, flame signal, time for ignition...)

- **At each operation cycle**

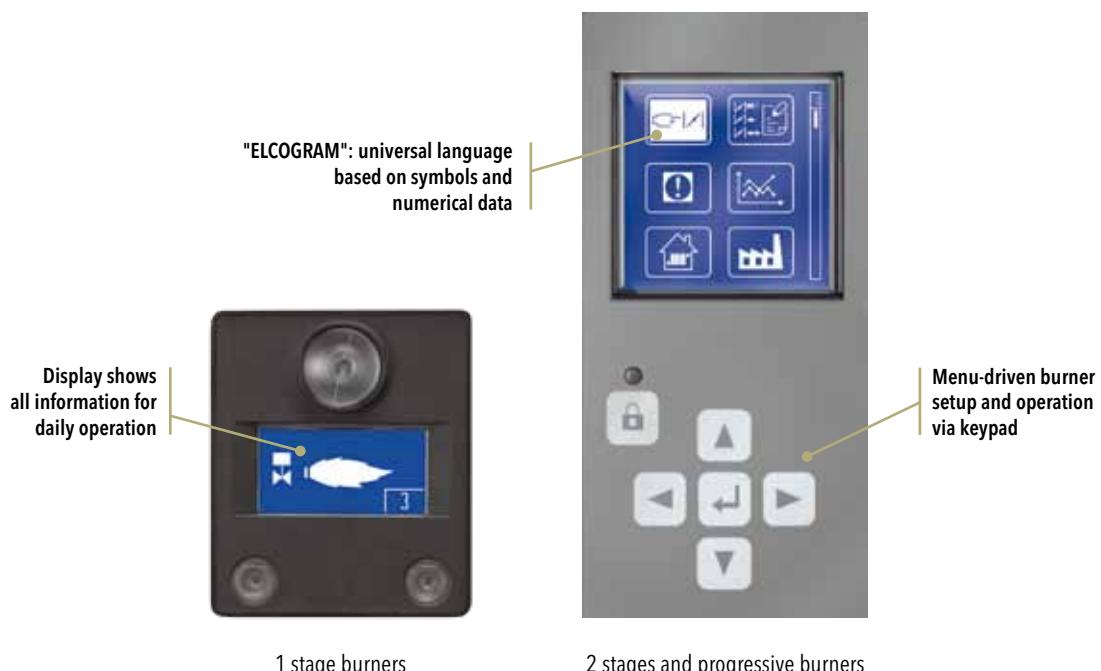

The system records every event that happened during the last heating season and displays the stored data in the form of statistics.

#### Elcogram, a universal language

As ELCO products are distributed worldwide, the company has developed a universal language composed of pictograms and numerical data.

The pictograms use the majority of the symbols used on the wiring diagrams which are recognised and understood by all Nations. This ensures that information is easier to read than ever before.

# ELCO OPERATIONS AND SYSTEMS

## Maintenance

### Choose a rapid and easy maintenance solution

In order to grant cost benefits and high performance on all ELCO burners, we implemented features that simplify commissioning and allow quick and efficient burner maintenance.

- **Quick: reduces downtime and cost of maintenance**
- **Efficient: grants optimal performance like after first commissioning**

For an easier maintenance, the combustion parts can be quickly removed, easily cleaned and, even when they are disassembled, they easily get back to their position after all the servicing work.

The RTC System developed by ELCO guarantees a simple commissioning and exceptional operation from first to last day of the heating season.

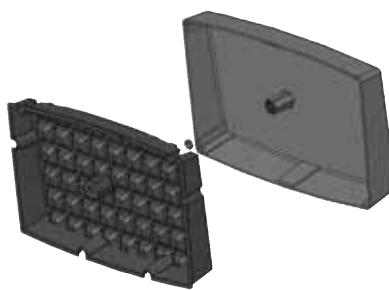

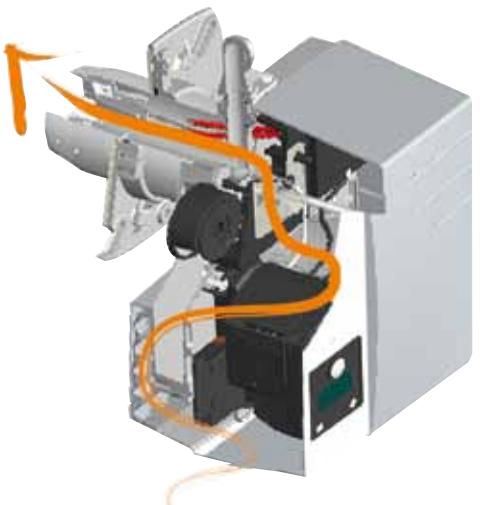

## Acoustic

### Silent and stylish: a dynamic and functional design

Among all the harmful things that men have to bear with every day, one of the most annoying is noise, which is difficult to reduce and expensive to get rid of.

This is the reason why ELCO has developed quiet burners both by selecting sound absorbent materials, and by treating each noise sources internally. The main noise comes from the air intake and the air mixing in the fan wheel: all the ELCO burners are equipped with a sound trap on the air intake channel leading to the fan. This brings the acoustic level to a compatible value in respect of the environment.

Optimal acoustic comfort

# ELCO OPERATIONS AND SYSTEMS

## Duo (D)

**The heat is even cleaner and more efficient**

Through an optimized combustion head design, patented as IME (Multi-stage Injection), this burner technology ensures a stable combustion quality and simultaneously ensures excellent energy efficiency.

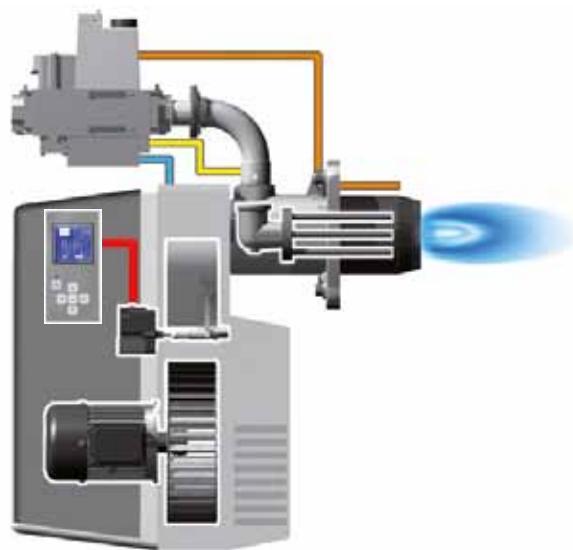

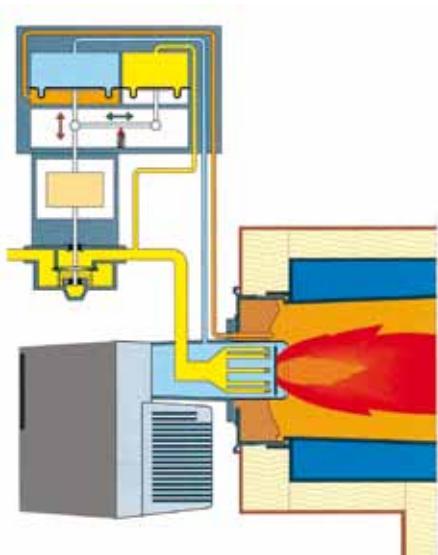

## Duo Plus (DP)

**An outstanding technology for our gas burners**

Developed and produced by ELCO, the AGP (proportional air-gas) system provides:

- perfect stability of the air-gas mixture;
- a constantly high CO<sub>2</sub> content over the whole burner output range;
- precise control of air excess, which is important for high-efficiency operation, in particular for condensing generators.

# ELCO OPERATIONS AND SYSTEMS

## Variatron (V)

### Cutting-edge technology for our modulating gas burners

To improve the performance of heating or industrial systems, ELCO applies Variatron (fan speed control)

In combination with AGP, we can ensure optimum combustion by constantly controlling minimum air excess in all operating conditions. In addition, electrical energy saving and low noise performance is obtained.

On V2, V3 and V4 models, Variatron can be chosen as a burner version or can be added as an option.

VG5 and VG6 models are available in electronic operation with built-in frequency converter, allowing the precise matching of the performance to the operative conditions and grants a higher modulating ratio.

## Modulo (M)

### Digital burner manager for our electronic gas burners

Everything is perfectly under control with high reliability and optimum combustion values. The new display ensures easy commissioning and provides real time information on burner operation with precise fault diagnosis based on a detailed error log.

The integrated gas leakage control provides additional security.

Ready to plug connection for REMOTE SOLUTION monitoring.

The electronic VG5 and VG6 models are available also equipped in order to work with permanent operation («PED» configuration).

The electronic control has specific functions and the flame sensor is a PED-compliant model.

# ELCO COMBUSTION TECHNOLOGIES

## ErP compliant

### Low emission burners in compliance with ErP Directive

Thanks to innovative combustion technologies and the experience developed on the field, ELCO is able to offer a Low NOx range able to meet -or exceed- the highest requirements and comply with the European Emission Standards, as well as those of many other countries. All the Vectron models up to VG4.440 and VL4.460 are ErP compliant and grant NOx emission values well below those imposed by the directive:

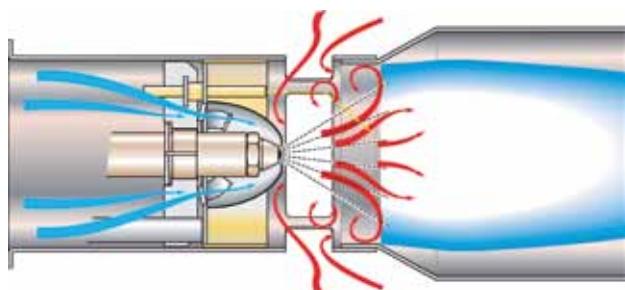

- Gas models up to VG4.440 <56 mg/kWh (based on GCV)
- Light oil models up to VL4.460 <120 mg/kWh (based on GCV)

## Blue Flame (VB)

### Low NOx Blue flame technology

The VECTRON Blue light oil burners have reached an excellent combustion technique for an improved quality of life. The combustion fuel is already in the form of gas-air mixture and ready for the combustion, thanks to the light oil atomizer. The result is a clean combustion with very low NOx emissions. These burners are electronically controlled and with the uncountable adjustable flue gas recirculation they can satisfy any installation requirements, from new boilers to older ones.

## Yellow Flame (VE)

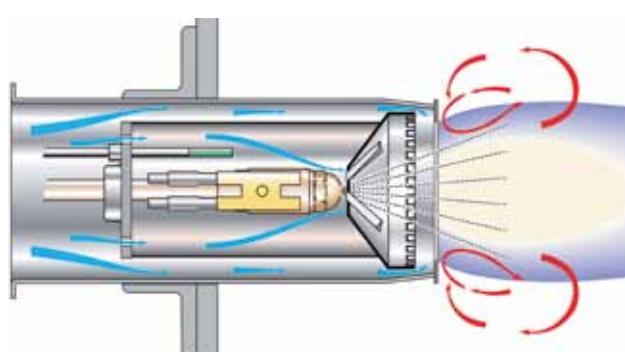

### Low NOx Yellow flame technology

The precision of the combustion head of the VECTRON Eco light oil burner series is particularly efficient and grants low NOx emissions.

The characteristic crown of baffle plates optimizes the combustion by mixing fuel and air.

The result of this innovative combustion head is a low air excess, a clean flame and high-efficiency energy saving.

The internal flue gas recirculation considerably reduces NOx emissions.

# ELCO COMBUSTION TECHNOLOGIES

## Ultra Low NOx version (FGR)

FGR System equipped burners

ELCO offers the VG5 and VG6 models in ULTRA Low NOx configuration thanks to the of the external FGR (Flue Gas Recirculation) technology.

The principle of the FGR System consists in sending a mixture of comburent air and flue gas to the combustion head, thus reducing the NOx emissions.

This technology enables ELCO to guarantee emissions of less than 30 mg/kWh, a value which is hard to obtain with conventional combustion systems.

## "R" versions (DP R, M R, M V R)

Low NOx class 2 burners with extended power range

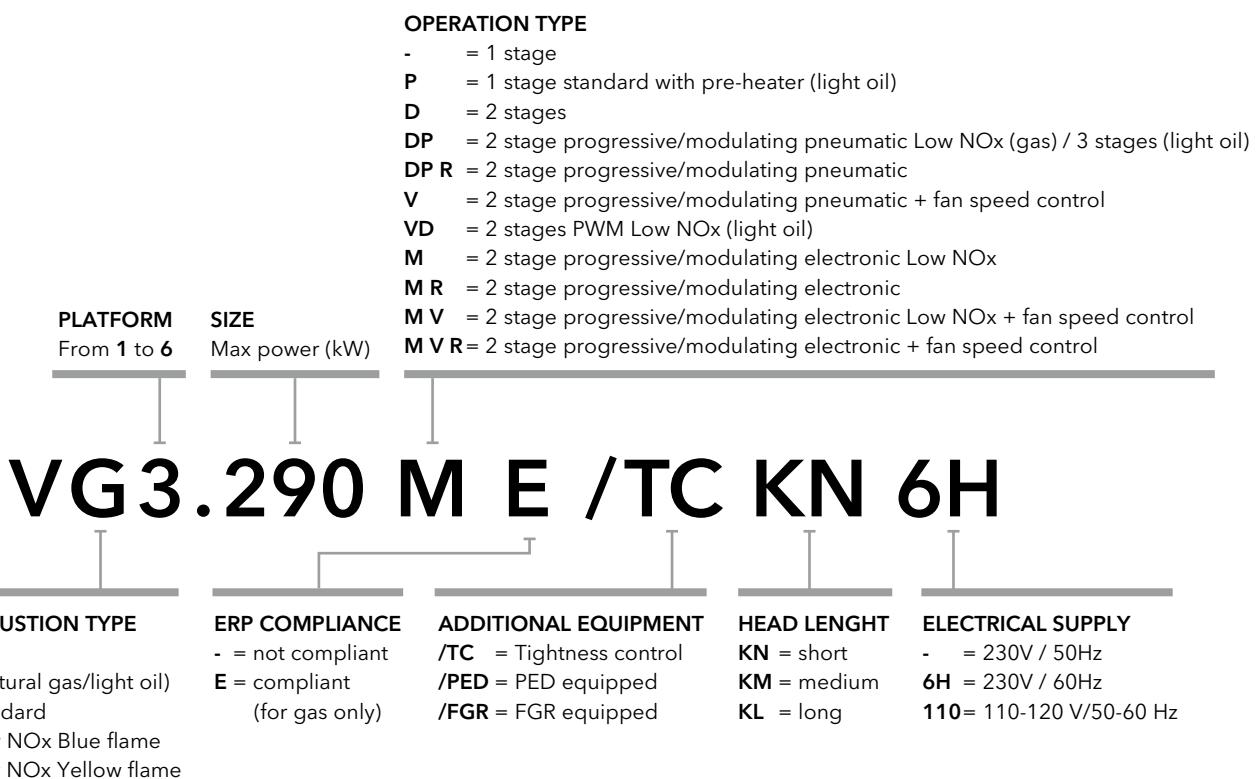

To complete the range, ELCO offers VG5 and VG6 models also in "R" version (low NOx class 2). This version combines a reliable and flexible combustion with an extended power range (up to 2300 kW) to cover a wider range of heating and industrial applications.

# TECHNICAL DATA

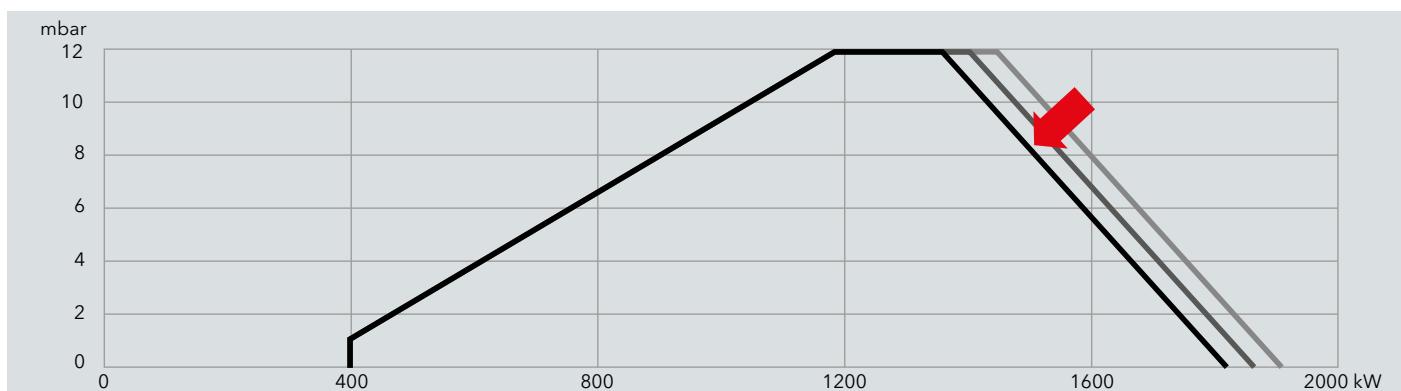

## FGR VERSIONS

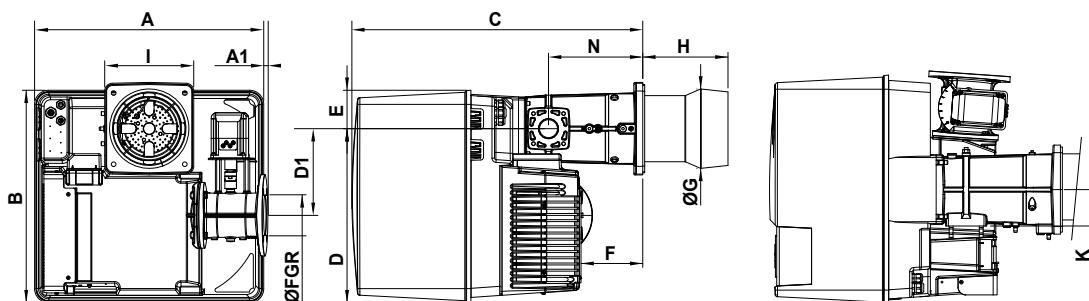

The external recirculation sends a mixture of air and flue gas to the burner combustion head. For monoblock units the gases are mixed upline of the combustion process by the burner fan. The effect in terms of NOx emissions is the result of numerous factors, the most important of which are: burners technical characteristics, fuel, type of generator, comburent air temperature, vector fluid temperature, thermal load of the combustion chamber.

When the FGR technology is applied to further reduce the NOx level, another parameter comes into play: the flue gas recirculation flow. The amount of recirculation, which is generally no more than 20% of the total flow generated by the fan, is calibrated for each application in relation to the target value and the system performance without recirculation.

There is not a single percentage value which suits all applications, because of the many factors in play and their interactions, but in any case the flue gas recirculation reduces the power of all monoblock burners, since part of the fresh comburent air is replaced by flue gas. This results in a lower O<sub>2</sub> content and hence reduces the combustion of fuel. The outcome is that the working diagram is reduced proportionately:
